Rotary Position Sensors

SMD/Lead Dust-proof Type 12mm Size SV01 Series

■ Features

1. Dust-proof construction protects the interior from dust, which maintains stable characteristics.
2. Excellent resistance materials and high reliability wiper achieves 1M cycles.
3. D formation thru-hole rotor enables selection of any kind of gear shape.
4. Both D formation thru-hole rotor and T formation thru-hole rotor are available.
5. Leaded terminal type is available.
6. Ultra-thin size (2.1mm height)
7. Au plated terminals without Lead.

■ Applications

1. Switch for automotive
2. Motor drive unit
3. Radio control equipment
4. Car audio (navigation system, changer)
5. Animal robot

SV01 Series Notice

■ Notice (Operating and Storage Conditions)

1. Store in temperatures of -10 to +40deg. C and relative humidity of 30-85%.
2. Do not store in or near corrosive gases.
3. Use within six months after delivery.
4. Open the package just before using.
5. Do not store under direct sunlight.
6. Do not use the rotary position sensor under the following environmental conditions. If you use the rotary position sensor in an environment other than listed below, please consult a Murata factory representative prior to using.
 - (1) Corrosive gasses atmosphere
(Ex. Chlorine gas, Hydrogen sulfide gas, Ammonia gas, Sulfuric acid gas, Nitric oxide gas, etc.)
 - (2) In liquid
(Ex. Water, Oil, Medical liquid, Organic solvent, etc.)
 - (3) Dusty / dirty atmosphere
 - (4) Direct sunlight
 - (5) Static voltage nor electric/magnetic fields
 - (6) Direct sea breeze
 - (7) Other variations of the above

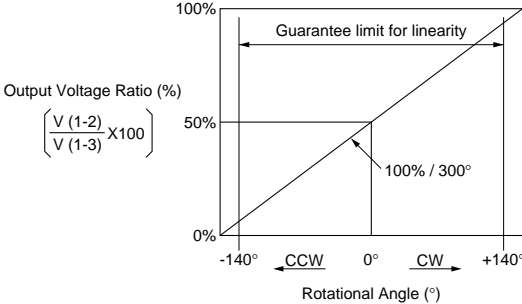

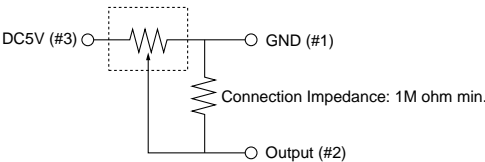

■ Notice (Soldering and Mounting)

1. Soldering
 - (1) SV01 series can be soldered by reflow soldering method and soldering iron. Do not use flow soldering method (dipping).
 - (2) The dimension of land pattern used should be Murata's standard land pattern at reflow soldering. Excessive land area may cause displacement due to the effect of the surface tension of the solder. Insufficient land area may cause insufficient soldering strength on PCB (SMD Type).
 - (3) Soldering conditions
Refer to the temperature profile.
If the soldering conditions are not suitable, e.g., excessive time and/or excessive temperature, the rotary position sensor may deviate from the specified characteristics.
 - (4) The amount of solder is critical. Insufficient amounts of solder can lead to insufficient soldering strength on PCB. Excessive amounts of solder may cause bridging between the terminals.
 - (5) The soldering iron should not come in contact with the cover of the rotary position sensor. If such contact does occur, the rotary position sensor may be damaged.
2. Mounting
 - (1) Use PCB hole to meet the pin of the rotary position sensor. If the rotary position sensor is inserted into insufficient PCB hole, the rotary position sensor may be damaged by mechanical stress (Lead type).
 - (2) Do not apply excessive force, preferable 9.8N max. (Ref. 1kgf) when the rotary position sensor is mounted to the PCB.
 - (3) Do not warp and/or bend PCB to prevent the rotary position sensor from breakage.
3. Cleaning
Cannot be cleaned because of open construction.

muRata

SV01 Series Specifications and Test Methods

The tests and measurements should be conducted under the condition of 15 to 35°C of temperature 25 to 75% of relative humidity and 86 to 106 kpa of atmospheric pressure unless otherwise specified. If questionable results occur that have been measured in accordance with the above mentioned conditions, the tests and measurements should be conducted under the condition of 25±2°C of temperature, 45 to 55% of relative humidity and 86 to 106 kpa of atmospheric pressure. When the potentiometer is tested after soldering on PCB, it should be tested after being kept in a room (15 to 35°C, 25 to 75%RH) over 24 hours except "Resistance to soldering heat".

No.	Item	Test Methods															
1	Linearity	<p>Linearity should be specified a deviation with the below ideal straight line, between ± 140 degrees from the index point which is 50% of out put voltage.</p> <p>The ideal straight line has 100%/300 degree as taper and pass the above index point.</p> <p>Measurement is performed using the following measurement circuit, and the rotor should be rotated to clockwise direction.</p> <div><div></div><div></div></div>															
2	Temperature Cycle (Thermal Shock)	<p>The rotary position sensor should be subjected to Table 2 temperature for 5 cycles.</p> <p>Then, the rotary position sensor should be kept in the dry box for 24 +8/-0 hrs.</p> <table><tr><th>Sequence</th><th>1</th><th>2</th><th>3</th><th>4</th></tr><tr><td>Temperature (°C)</td><td>-40\pm3</td><td>+25\pm2</td><td>+85\pm3</td><td>+25\pm2</td></tr><tr><td>Time (min.)</td><td>30</td><td>5 max.</td><td>30</td><td>5 max.</td></tr></table> <p>Table 2: One cycle of temperature cycle</p>	Sequence	1	2	3	4	Temperature (°C)	-40 \pm 3	+25 \pm 2	+85 \pm 3	+25 \pm 2	Time (min.)	30	5 max.	30	5 max.
Sequence	1	2	3	4													
Temperature (°C)	-40 \pm 3	+25 \pm 2	+85 \pm 3	+25 \pm 2													
Time (min.)	30	5 max.	30	5 max.													
3	Humidity	<p>The rotary position sensor should be stored in a chamber at temperature of +60\pm2°C and relative humidity of 90-95% for 250\pm8 hrs. After removing from the chamber, the rotary position sensor should be kept in the dry box for 24 +8/-0 hours.</p>															
4	Vibration	<p>The rotary position sensor should be tested under the condition of the amplitude of 1.5mm, the frequency range from 10 to 55Hz (should be traversed in approximately one minute) and 2 hours in each of 3 mutually perpendicular directions (total 6 hours).</p> <p>Then, the rotary position sensor should be kept in the dry box for 1-2 hrs.</p>															
5	Shock	<p>The rotary position sensor should be tested under the condition of the peak acceleration 20G max. in half-sine wave and 5 shocks in each of 3 mutually perpendicular directions (total 15 shocks). Then, the rotary position sensor should be kept in the dry box for 1-2 hrs.</p>															
6	Humidity Load Life	<p>Full rated continuous working voltage not exceeding 5Vdc should be applied intermittently between terminal #1 and terminal #3 of the rotary position sensor, 1.5 hours on and 0.5 hours off, for 96\pm4 hours in total in a chamber at a temperature of +40\pm2°C and relative humidity of 90-95%. After removing from the chamber, the rotary position sensor should be kept in the dry box for 24 +8/-0 hours.</p>															
7	High Temp. Exposure	<p>The rotary position sensor should be stored in a chamber at the temperature of +85\pm3°C without loading for 250\pm8 hours. After removing from the chamber, the rotary position sensor should be kept in the dry box for 24 +8/-0 hours.</p>															
8	Low Temp. Exposure	<p>The rotary position sensor should be stored in a chamber at the temperature of -40\pm3°C without loading for 168\pm4 hours. After removing from the chamber, the rotary position sensor should be kept in the dry box for 24 +8/-0 hours.</p>															
9	Rotational Life	<p>The adjustment rotor should be continuously rotated within $\pm 160^\circ$ of effective electrical rotational angle, at the rate of one cycle for 6 seconds for 1 Million cycles under the condition of +25\pm2°C of temperature without loading.</p>

SV01 Series Application Manual

1. Storage

- The electrodes of each SV01 series rotary position sensor (hereafter called "product") are plated (Au plating over Ni plating) to ensure solderability.
- However, if a product is exposed to high temperature and humidity, sulfur gas, or other contaminated environment, the surface of the electrodes may oxidize or sulfidize, resulting in defective soldering.
- The following are the precautions to be observed concerning storage management, so please refer to them.

(1) Storage environment

Ensure that the atmosphere is within a temperature range of between -10 and 40°C, and a humidity range of between 30 and 85%RH, and does not contain chlorine, sulfur, or other corrosive gas. Also, avoid storing the products in a location that is exposed to direct sunlight.

(2) Storage method

Store products in a condition such that the minimum packing boxes are not subjected to a load. Do not stack the boxes to the extent that the bottom box becomes deformed under the weight of the boxes stacked on top of it.

(3) Storage period

Use products within 6 months after they are shipped from us. If you use products after 6 months have elapsed, carry out a solderability test to make sure that there is no problem prior to use.

2. Board Design

<1> SMD components

(1) Land pattern (use recommend land pattern only)

When a land pattern area that is greater than necessary is used, a positional error or rotation of the product may occur due to the effect of the surface tension of the solder, which may result in trouble when the product is connected to a mechanical part.

Also, if the land pattern area is too small, the force bonding the product to the printed circuit board will be low, which may result in the product separating from the board.

In order to prevent the above trouble, please use our standard land pattern.

This product has two #2 terminals, at positions A and B to ensure flexibility of mounting on the board to cope with various wiring layouts.

This permits "in-line use" in which the #1 and #3 terminals are connected with the #2 terminal on the same side (A), or "zigzag alignment use" in which the #2 terminal on the B side is connected to the circuit. In the case of "in-line use" as well, be sure to provide a land for the #2 terminal on the B side in order to ensure that the product is fixed to the board with adequate force.

Continued on the following page.

SV01 Series Application Manual

Continued from the preceding page.

(2) Locating holes on print circuit board

The mounting position of the product is determined by the holes in the following three places.

- ① Center position (X-and Y-directions) is determined by Hole (one location) for boss at rear of product.
- ② Rotation angle (θ angle) is determined by hole(s) for locating pins at rear of product. (θ -angle can be fixed by one hole or two holes.)

Determine the dimension of the locating holes as follows, depending upon the method of mounting the product (when mounting the product using a mounter or mounting it by hand).

- ① When mounting the product by hand

- ② When using a mounter

Expand the size of each hole to account for the accuracy of the mounters.

Note, however, that the accuracy of the mounting position of the product is determined by the "accuracy of the mounter".

<2> Leaded parts

(1) Thru-holes

Determine the thru-hole positions so as to match the terminal pitch of the product. If you attempt to mount the product into thru-holes that do not match the terminal pitch, the terminals may become deformed and in the worst case may break. Also, random variations in the mounting position of the product may occur.

In order to prevent the above trouble, use our standard thru-hole dimensions.

(2) Positioning accuracy

Compared to an SMD product, there is a tendency for large variations in the mounting position of the product to occur. If positioning accuracy is important when making connection to a mechanical part, we recommend that you use an SMD product.

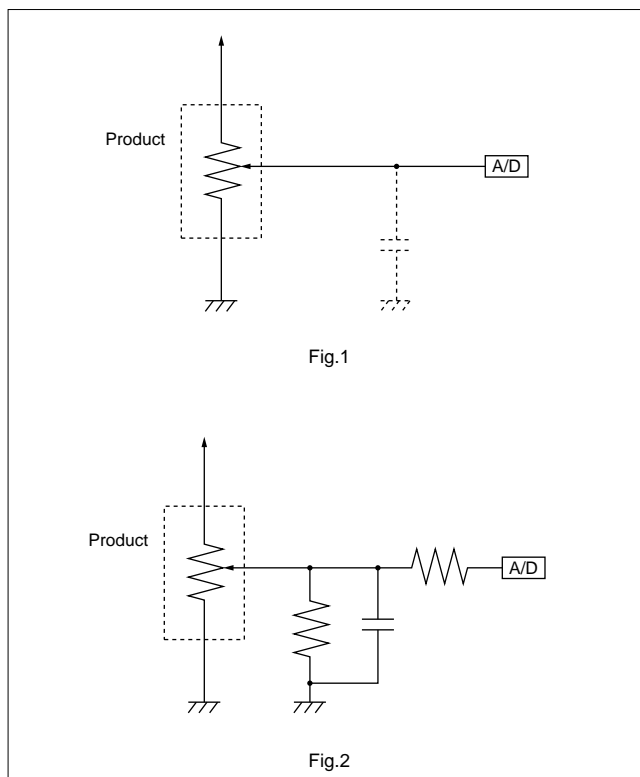

Continued on the following page.

Continued from the preceding page.

3. Circuit Design

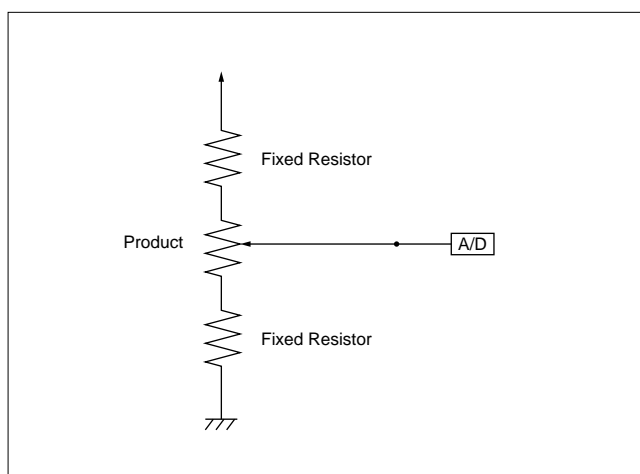

(1) Recommended circuit

- This product is designed on the assumption that it is to be used with the output terminals directly connected to the A/D port of a microprocessor as shown in Fig.1. In other words, the contact resistance inside the product is slightly high based on the assumption that the connection impedance value is of the order of megohms. Consequently, when using the product in the circuit of Fig.2, take steps to ensure that the connection impedance does not fall below $1\text{M}\Omega$. (Refer to sub-section 3 of 8. Examples of Actual Trouble and Preventive Measures.)

(2) Avoid inserting a fixed resistor in series with the sensor.

- Because the resistive element used in this product is a "carbon resistive element", its temperature characteristics cause its total resistance value to change with the ambient temperature. The total resistance also changes due to changes in the external environment along with the passage of time. However, the resistance of each parts of the resistive element changes uniformly, so the "output voltage characteristics" which are determined by the voltage division ratio due to the contact point will not be greatly affected.
- Note, however, that if fixed resistors are connected in series with the product as shown in the figure at right, the "output voltage characteristics" may be adversely affected by the difference in the rate of change of the resistance of the fixed resistors and that of the resistive element of the product. For this reason, avoid connecting fixed resistor in series with the sensor.

(3) Avoid using the product at a voltage that exceeds the rated voltage.

- If the product is used at a voltage that exceeds the rated voltage, the resulting abnormal heat generation may impair the function of the product.

Continued on the following page. ↗

SV01 Series Application Manual

Continued from the preceding page.

4. Mechanical Design

(1) Cross-section dimension of the shaft inserted into the rotor

- The cross-section dimension of the shaft inserted into the rotor of the product greatly affects the characteristics of the product.
- If the dimension is too small, backlash between the product rotor and the inserted shaft will occur, which may cause a delay in the change in the output voltage accompanying the rotation of the shaft.
- If the dimension is too large, the rotor will break, resulting in an increase in the rotational torque and also abnormal wear of the product bearing. In addition, wear dust from the bearing in which wear occurs may adversely affect the characteristics of the output voltage, and so on.

(2) Load on the product bearing

- If a thrust, radial, or twist load, for example, is applied to the rotor bearing, the electrical characteristics may change, the rotational torque may increase, or mechanical damage may occur. When designing a system, pay attention to the following points.
 - ① Mount the product only by soldering the terminals.
Avoid screwing it to an auxiliary board, for example, because this may cause deformation of the product.
 - ② The shaft that is inserted into the rotor is supported by a bearing, so do not apply a load to this bearing.
(Refer to sub-section 1 of 8. Examples of Actual Trouble and Preventive Measures.)

5. System Design

(1) Precautions for loading data

Implement the following software measures in order to minimize data loading failures which occur occasionally, and also the effect of sliding noise and external noise.

- ① Perform several data loading operations and obtain the mean value.
- ② Disable data that is considered to be the cause of data loading failures.
- ③ If any doubt arises, take appropriate action such as carrying out a data acquisition operation once again.

(2) When using software to adjust the output voltage characteristics

- Depending upon the characteristics of the microprocessor, a delay in the actual sensor output voltage may occur. Take this point into consideration when designing a system.
- If a delay in the output voltage constitutes a problem, we will study the feasibility of customizing the output voltage characteristics as shown at right. For details, please contact us.

Effective Rotation Angle Change
Accommodates to an arbitrary angle (max. 350°)

Stepped output

Curvature change point setting

Continued on the following page.

 Continued from the preceding page.

6. Mounting the Products on a Printed Circuit Board and Soldering It

<1> When mounting the product with a mounter, and reflow soldering it

(1) Quantity of solder paste

- The standard coating thickness of solder paste used on SMD products is 150μm.
- If the quantity of solder is insufficient, the solder adhesion strength may be inadequate.
Conversely, if there is too much solder, ① solder bridging or ② ingress of flux into the product may occur, impairing the contact condition of the electrical contacts.
This in turn will result in an abnormal output voltage.
- The standard solder paste is Sn-3Ag-0.5Cu.

(2) Applicable mounter

- A rotary position sensor is an "atypical component", so it is necessary to use a "placement machine suitable for this part". (Refer to the table below. For details, please contact the various mounter manufacturers.)
- The judgment concerning whether or not a particular mounter is suitable depends upon the required mounting speed and mounting position accuracy. Be sure to carry out an advance mounting check on the actual manufacturing line.

Continued on the following page. 

SV01 Series Application Manual

Continued from the preceding page.

(3) Reflow temperature profile

The standard conditions are shown to the right.

<2> When mounting the product by hand and soldering it with a soldering iron

(1) Quantity of solder

- For both SMD and leaded products, supply a quantity of wire solder that is within the range where solder bridging between the terminals does not occur.
- The standard wire solder is Sn-3Ag-0.5Cu.

(2) Soldering iron

- The standard conditions are as shown at right.

Temperature of soldering iron tip: 350±10°C
 Soldering time : Within 3 seconds per terminal
 Diameter of the soldering iron tip: ø3mm max.
 Wattage of iron : 30W max.

- When soldering, take care that the tip of the soldering iron does not come into direct contact with the product (cover, rotor, plastic substrate, etc.). If such contact does occur, the product may be damaged.

- Heat both the terminal and the land at the same time so that the wire solder melts quickly. This will reduce deformation of the resin substrate of the product due to heat transmitted from the terminals.

<3> Washing

- This product is not of a sealed construction so you cannot wash it.

Continued on the following page.

Continued from the preceding page.

7. Connecting the Product to a Mechanical Part

- In case of using grease or lubricant on connecting shaft or gear, please prevent grease or lubricant coming into the product. If grease or lubricant gets inside the product, the product may deviate from the specified characteristics. (Refer to sub-section 2 of 8. Examples of Actual Trouble and Preventive Measures.)
- When combining the product with a mechanical part, please, ensure that the center of the product's rotor hole coincides with the center of the shaft that is to be inserted into the rotor. (Refer to sub-section 5 of 8. Examples of Actual Trouble and Preventive Measures.)

8. Examples of Actual Trouble and Preventive Measures

1. Do not apply a load other than rotational motion to the bearing.

Because this product has been designed with emphasis on miniaturization and low weight, the bearing is not intended to support a load. For this reason, please, provide a separate bearing function to ensure that an excessively high load is not applied to the bearing of the product.

If a load is applied to the bearing in the radial or thrust direction, the bearing may wear, resulting in the following trouble.

- ① Deterioration of output voltage linearity due to backlash in the rotor
- ② Deterioration of the contact condition of the contacts due to wear dust

Also, be sure to carry out an evaluation using an actual machine.

2. Do not allow grease or other lubricant to get into the product.

The rotational life of this product has been increased by appropriate selection of materials, processing method, and so on, without relying on lubricants. Consequently, if grease or other lubricant gets into the product, trouble is likely to occur.

This product is not of a sealed construction, so lubricant may flow into it from the bearing or gaps in the case, for example. When it is unavoidably necessary to coat a gear, or other part, that you use with grease, or another lubricant, take the following precautions to prevent grease from getting into the product.

- ① Use a high viscosity lubricant
- ② Do not allow lubricant to get onto the shaft that is to be connected to the product. (In the case of a shaft that is integral with the gear, apply lubricant only to the gear teeth.)

Continued on the following page.

SV01 Series Application Manual

Continued from the preceding page.

3. Ensure that the connection impedance is at least 1MΩ.

This product has increased contact resistance (sliding noise) in order to maximize its rotational life. Consequently, in order to reduce the effect of sliding noise, it is necessary to reduce the current flowing through the contacts (current i indicated in the figure at right) as far as possible. Accordingly, take steps to ensure that the internal impedance of the circuit connected to the output terminal (#2 terminal) is at least 1MΩ. Be particularly careful in the case of the filter circuit shown in the figure at right.

The graph at right shows the results of measuring the output voltage linearity of the same sample when the impedance to which it is connected is changed between 1MΩ and 200kΩ. It can be seen that the effect of sliding noise is reduced when the connection impedance is increased.

Graph 1 When the connection impedance is 1MΩ

Graph 2 When the connection impedance is 200kΩ

4. When using the product in an atmosphere containing a corrosive gas (chlorine, sulfur, etc.), install it in a sealed structure.

This product is not of a sealed construction, so the contacts and resistive element inside it are exposed directly to the ambient air. For this reason, if the product is used in an atmosphere containing a corrosive gas, the contacts and resistive element may corrode. When it is unavoidably necessary to use the product in an atmosphere containing a corrosive gas, install the product in a sealed structure.

5. Ensure that the positions of the mechanical part (shaft) that you wish to connect to the product and the product rotor hole do not become misaligned.

When combining a mechanical part with the product, ensure that the center of the product rotor hole coincides with the center of the shaft to be inserted into the rotor. If you use these parts in a misaligned condition, the bearing may wear, resulting in the following trouble.

- ① Deterioration of output voltage linearity due to play in the rotor
- ② Deterioration of the contact condition of the contacts due to wear dust

Qualified Standards

■ Qualified Standards
